Participations across 100+ titles a year

Prepared for Breaking Glass Pictures. All example data below is fictional.

The problem

An aggregator releases titles across transactional, subscription, ad supported, and disc channels, plus international sales. Each title carries its own producer, director, and sales participations.

Here is one fictional title in one quarter.

Item	Rule	Amount
Title receipts	All channels, one quarter	$48,500.00
Platform and channel fees	20% of receipts	$9,700.00
Producer participation	45% of net	$17,460.00
Director participation	5% of net	$1,940.00
Sales agent share	10% of net	$3,880.00
Distributor retained	40% of net	$15,520.00

Multiply this by a full slate and the risk is consistency. One title's fee basis or participation rate applied to the next title quietly moves money to the wrong party.

> At slate volume, the burden is proving that each title was calculated on its own deal, every quarter.

The same example in RevRule

RevRule stores one rule graph per title. Inputs: receipts by title and channel, the fee basis, and each participant's rate.

The same title calculates the same way each period, and a renegotiated term takes effect on its stated date rather than whenever a spreadsheet gets updated.

Participant	Rule applied	Amount owed
Platform and channel fees	20% of gross	$9,700.00
Producer	45% of net	$17,460.00
Director	5% of net	$1,940.00
Sales agent	10% of net	$3,880.00
Distributor	40% of net	$15,520.00
Total	Matches receipts	$48,500.00

Each result is recorded with its inputs and rule version. A producer asking about a quarter can be shown the calculation itself.

RevRule gives a high volume distributor one auditable calculation record per title, across every channel the title earns in.
