One Campaign Fee, Four Splits, Two Different Answers

Prepared for Bent Pixels Asia. Fictional worked example from a published agency fixture design; every figure can be checked by hand.

The problem

Between the brand fee and the creator's payout sits a chain of splits: agency commission, a manager's share, sometimes two managements, recoupable production costs, and a usage window with an expiry date. Every link should be computable by both sides. Usually only one side can compute it, and the first place the numbers diverge is a single phrase: a manager's share defined as a percentage of the talent share, not of the gross.

Step	Base	Amount (PHP)
Brand fee, one fictional campaign	Gross	1,000,000
Agency commission, 20 percent	Gross	200,000
Talent share	Remainder	800,000
Manager, 10 percent of the talent share	Talent share	80,000
Two talents at contracted rates	Remainder	720,000

The deal also carries a 90-day paid usage window and a production-cost recoupment against the campaign. Tracked in email and chat threads, the window quietly overruns and the recoupment is whatever the spreadsheet says it is. Neither side can re-derive the other's number, so a question about one campaign becomes a dispute about the whole relationship.

The same example in RevRule

RevRule models a campaign as one Revenue Graph: the brand fee as an event, the agency commission, manager share, any co-management split, and recoupment as ordered rules with defined bases, and the usage window as a dated entitlement that expires on a specific date rather than when someone remembers it.

What each party can verify	How
The agency commission base	The rule states gross, in the graph
The manager's 80,000	10 percent of the talent share, as defined
The production-cost recoupment	A balance applied in event order
The usage window	A dated entitlement with a visible expiry
Any channel's share	Checked against the full ledger, not a sample

Each computation lands in a hash-chained ledger, returnable in full as JSON. A sample of a ledger proves nothing about the entries left out; the full record is what ends the argument. For a network allocating reserved media revenue across hundreds of creators, that is the difference between an allocation creators trust and one they screenshot.

RevRule does not hold funds, execute payments, or take a percentage of campaign money. It is licensed software, priced the same regardless of the volume it computes.
