Subscription and limited edition revenue, split per artist

Prepared for Joyful Noise Recordings. All example data below is fictional.

The problem

A small label team runs standard releases alongside subscription series and limited editions. Each format still has to land in the right artist's royalty account, with producer and featured artist shares and open recoupment handled per release.

Here is one fictional release in one period.

Item	Rule	Amount
Release receipts	All formats, one period	$74,600.00
Artist share	55% of receipts	$41,030.00
Recoupment applied	Open advance balance	$9,500.00
Artist net	Share less recoupment	$31,530.00
Producer share	8% of receipts	$5,968.00
Featured artist share	4% of receipts	$2,984.00

With about ten people running the whole label, royalty accounting competes with everything else. The work is not hard math. It is the same care, applied to every artist, every period.

> A transparency minded label needs its royalty record to be as checkable as its reputation.

The same example in RevRule

RevRule models each release as a rule graph. Inputs: receipts by release and format, the artist, producer, and featured artist rates, and the open recoupment balance for that artist.

Recoupment is applied against the artist's calculated share and the remaining balance carries forward in the ledger.

Participant	Rule applied	Amount owed
Artist, net	55% less $9,500 recoupment	$31,530.00
Producer	8% of receipts	$5,968.00
Featured artist	4% of receipts	$2,984.00
Label	Retained share plus recoupment credit	$34,118.00
Total	Matches receipts	$74,600.00

Subscription series revenue enters as its own receipt events under the same release rules, so special formats stop needing special spreadsheets.

RevRule gives a small label team a consistent, auditable royalty calculation for every release and every format.
