Recoupment Balances Should Be Engine State, Not a Side Tab

Prepared for Royalty Solutions Corp. Fictional example, published synthetic fixture.

The problem

An advance is paid once. Recouping it correctly takes every revenue event after that, in order, against the right balance, at the right rate. In a spreadsheet the balance usually lives in a side tab that someone must remember to update, per participant and per agreement.

The failures are familiar: a balance that goes stale after a busy period, a producer kept at the recoupment rate after the balance cleared, and one event that straddles the clearing point, split across the line by hand.

Fixture inputs	Terms	
Producer advance, track A	$300.00	100 percent recoup rate
Producer advance, track B	$450.00	100 percent recoup rate
Rate after an advance clears	5 percent royalty	Applies only after clearing
Producer totals for the quarter	$2,782.99 to $3,063.09	Recouped amounts plus post-rate e

When a producer asks how much of the advance is left, the honest answer in a spreadsheet workflow is a reconstruction. The balance was never engine state, so nobody can simply look it up.

The same example in RevRule

RevRule defines the deal once as a Revenue Graph: participants, shares, recoupment balances, the recoup rate, and the rate that applies after the advance clears. Revenue events are recorded as money arrives, and each event is applied against outstanding balances in order.

What the engine records	Detail	
Every event	Amount applied against the balance	Cumulative recouped total in the le
The clearing event	Split exactly at the zero point	Remainder earns at the 5 percent p
After clearing	5 percent royalty	Never the recoupment treatment or
The balance question	A query, not a reconstruction	Current position per participant, on

All 40 graph ledgers in the fixture passed hash-chain verification, and an independent re-implementation of the rule math reproduced every participant total exactly. For a white-label royalty department, that ledger sits underneath the service: the administrator keeps the client relationship and the brand, and the calculation layer produces statements whose math is already evidenced.

RevRule does not hold funds, execute payments, or collect royalties. It computes what is owed under your rules for money already collected.
