Four catalogs, four sets of legacy terms

Prepared for Compass Records Group. All example data below is fictional.

The problem

An acquired catalog rarely arrives with one clean deal structure. Each catalog keeps its own artist rates, producer points, and open recoupment balances, and the label still has to run one royalty cycle.

Here is one fictional quarter across four catalogs.

Catalog	Receipts	Legacy terms	Artist net
Northline	$92,000	50% artist share, $12,000 recoupment open	$34,000.00
Harbor	$76,500	55% artist, 5% producer	$42,075.00
Juniper	$64,300	45% artist, 5% featured artist	$28,935.00
Atlas	$53,600	60% artist share, $8,400 recoupment open	$23,760.00
Total	$286,400	Four different rule sets	$128,770.00

A spreadsheet can hold these numbers. What it cannot do well is prove, years later, which legacy term produced which payment, or stop one catalog's recoupment from leaking into another catalog's balance.

> The burden grows with every acquisition: more catalogs, more legacy terms, one small team answering for all of it.

The same example in RevRule

RevRule models each catalog as its own rule graph. Inputs: receipts by catalog, the artist and producer rates, and the open recoupment balance for that catalog only.

Recoupment is applied inside the catalog where the advance belongs. Nothing crosses into another catalog's balance.

Participant	Basis	Amount owed
Artists, net of recoupment	Per catalog rules	$128,770.00
Producer	Harbor catalog, 5%	$3,825.00
Featured artist	Juniper catalog, 5%	$3,215.00
Label retained	Remainder across catalogs	$150,590.00
Total	Matches receipts	$286,400.00

Every amount links back to the receipt event and the rule version that produced it, so an artist question can be answered from the record instead of from memory.

RevRule lets an acquiring label keep each catalog's original terms and still run one consistent, auditable royalty process.
