The split changed on paper, late in the file

Prepared for Soundbook Financial. All example data below is fictional.

The problem

A label client renegotiates an artist split from 50 percent to 60 percent, effective August 15. The accounting file gets updated in September, and the new rate is applied from September 1.

Here is the fictional quarter, reduced to the four tracks the change touched.

Item	Detail	Amount
Quarter receipts	Four tracks	$96,000.00
Earnings in the window	August 15 to August 31	$18,400.00
Artist paid in window	At the old 50% rate	$9,200.00
Artist owed in window	At the new 60% rate	$11,040.00
Correction owed	Difference on the window	$1,840.00

The label's spreadsheet applied the old rate until the end of August. Nobody made an arithmetic mistake. The rule changed, and the workbook did not.

> Most royalty corrections are timing problems: the right rate, applied from the wrong date.

The same example in RevRule

RevRule applies rates by effective date. Inputs: the receipt events, the artist rate before and after the renegotiation, and the date the new rate takes effect.

The engine calculates the window at the correct rate and records the correction as a new ledger entry linked to the original, rather than editing history.

Participant	Rule applied	Amount owed
Artist	50% before August 15, 60% from August 15	$49,840.00
Label	Remainder	$46,160.00
Total	Matches receipts	$96,000.00
Of which: correction	Window restated at 60%	$1,840.00

For the firm reviewing the label's books, the value is the trail: the original entry, the rule change, and the correction, all visible in one record.

RevRule gives a music finance firm a correction trail it can show a client: what changed, when it took effect, and what it is worth.
