Every title has more than one creator

Prepared for Page Street Publishing. All example data below is fictional.

The problem

A cookbook or illustrated title rarely has a single royalty participant. The author, the photographer, and the illustrator each hold a share, and print, audio, and subsidiary rights can each follow different terms.

Here is one fictional title in one period.

Item	Rule	Amount
Title receipts	All formats, one period	$58,400.00
Author share	45% of receipts	$26,280.00
Photographer share	20% of receipts	$11,680.00
Illustrator share	10% of receipts	$5,840.00
Publisher retained	25% of receipts	$14,600.00

Across a full list, each title's contributor mix and format terms differ. A royalty run built by hand invites the one error an author notices immediately: someone else's rate on their title.

> Multi contributor titles need the split recorded per title, not remembered per spreadsheet.

The same example in RevRule

RevRule stores one rule graph per title. Inputs: receipts by title and format, each contributor's role, and the share or rate for that role.

The engine calculates every participant's entitlement for the period and records the inputs and rule version behind each amount.

Participant	Rule applied	Amount owed
Author	45% of receipts	$26,280.00
Photographer	20% of receipts	$11,680.00
Illustrator	10% of receipts	$5,840.00
Publisher	25% of receipts	$14,600.00
Total	Matches receipts	$58,400.00

Format specific terms sit in the same graph, so audio or subsidiary income follows its own rules without a separate workbook.

RevRule gives a multi contributor list one recorded calculation per title that every participant's figure can be traced back to.
