Royalty transparency authors can check

Prepared for She Writes Press and SparkPress. All example data below is fictional. The split structure follows the model the press publishes.

The problem

A hybrid publisher's promise to authors is transparency: published splits, clear distribution fees, and royalties an author can follow. Keeping that promise across hundreds of titles, in print and ebook, is an operations problem.

Here is one fictional title in one period, using the published split structure.

Format	Receipts	Distribution fee 40%	Author share	Publisher share
Print	$50,000	$20,000.00	$18,000.00 at 60%	$12,000.00
Ebook	$20,000	$8,000.00	$8,400.00 at 70%	$3,600.00
Total	$70,000	$28,000.00	$26,400.00	$15,600.00

The math is published, which is the point. The burden is applying it identically to every title and being able to show an author exactly how a figure was reached.

> Transparency is a differentiator only when the underlying calculation can be shown, not just stated.

The same example in RevRule

RevRule encodes the published model as rules. Inputs: receipts by title and format, the distribution fee, and the author split for that format.

Each title's entitlements are calculated and recorded, so an author's figure for a period can be traced to receipts, fee, and split.

Participant	Rule applied	Amount owed
Distributor	40% fee, both formats	$28,000.00
Author	60% print net, 70% ebook net	$26,400.00
Publisher	Remainder of net	$15,600.00
Total	Matches receipts	$70,000.00

Where an author package is recouped against royalties, the balance is a recorded rule in the same ledger, reduced by each period's calculated entitlement.

RevRule helps a transparency led publisher prove every royalty figure from a recorded calculation, title by title.
