Commission splits across 164 agents

Prepared for Driven Properties. All example data below is fictional.

The problem

A brokerage commission looks simple on one deal. Across four offices it rarely is: listing and closing agents split the fee, team leads take a share, co-broking and referral arrangements divide it further, and developer commissions follow their own terms.

Here is one fictional sale.

Item	Rule	Amount
Sale price	One residential sale	AED 3,800,000
Brokerage commission	2% of sale price	AED 76,000
Listing agent	50% of commission	AED 38,000
Closing agent	30% of commission	AED 22,800
Team lead	10% of commission	AED 7,600
Brokerage retained	10% of commission	AED 7,600

Now vary the split by office, seniority, or partner model, and add a referral fee on cross border deals. A spreadsheet per deal becomes a reconciliation project every month.

> Agents trust the brokerage when every commission can be traced to the deal terms that produced it.

The same example in RevRule

RevRule records the commission structure as rules per deal. Inputs: the sale price, the commission rate, and the role assignments and shares for that transaction.

The engine calculates each participant's entitlement and stores the calculation with the deal record.

Participant	Rule applied	Amount owed
Listing agent	50% of commission	AED 38,000
Closing agent	30% of commission	AED 22,800
Team lead	10% of commission	AED 7,600
Brokerage	10% retained	AED 7,600
Total commission	2% of sale price	AED 76,000

Co-broker shares and referral fees become additional recorded rules on the same deal, so the monthly run is a query against the ledger rather than a rebuild from inboxes.

RevRule gives a brokerage one verifiable commission record per deal, however many ways the fee is split.
