Revenue shares across a gaming roster

Prepared for Ampverse Philippines. All example data below is fictional.

The problem

Gaming talent deals mix minimum guarantees, revenue shares, and exclusivity windows. When a campaign closes, the agency has to split one pool of money across the organisation, the players, the creator, and the coach, each under different terms.

Here is one fictional campaign and content pool.

Item	Rule	Amount
Campaign and content revenue	One period, one roster group	PHP 1,800,000
Platform fees	15% of revenue	PHP 270,000
Agency commission	20% of net	PHP 306,000
Players	70% of talent pool	PHP 856,800
Content creator	20% of talent pool	PHP 244,800
Coach	10% of talent pool	PHP 122,400

The hard part is the mix. A minimum guarantee has to be credited against the share, and an exclusivity window decides which deals belong in the pool at all.

> When every deal is structured a little differently, a manual split is where disputes start.

The same example in RevRule

RevRule records the deal terms as rules before revenue arrives. Inputs: the revenue event, the platform fee, the agency rate, the talent pool shares, and any guarantee already advanced.

Guarantees are credited against the calculated share, and each result is written to a ledger the talent can check.

Participant	Rule applied	Amount owed
Platform fees	15% of gross	PHP 270,000
Agency	20% of net	PHP 306,000
Players	70% of talent pool	PHP 856,800
Content creator	20% of talent pool	PHP 244,800
Coach	10% of talent pool	PHP 122,400
Total	Matches revenue	PHP 1,800,000

Because the rule set is dated, a share that changes next season applies from its effective date. Earlier periods keep the terms that were in force.

RevRule turns each structured deal into a recorded calculation, so guarantees, shares, and exclusivity windows reconcile in one place.
