One event, several parties, one split

Prepared for Open Mic Productions. All example data below is fictional.

The problem

A live event pays several parties out of one ticket pool: the venue, the headline artist, the promoter, and the ticketing partner. When a show is co-created, the split has to be agreed before the money arrives and provable after it does.

Here is one fictional event.

Item	Rule	Amount
Ticket gross	One event	R1,250,000
Venue share	30% of gross	R375,000
Headline artist	65% of net	R568,750
Promoter	25% of net	R218,750
Ticketing partner	10% of net	R87,500

When the split lives in messages and spreadsheets, every party keeps a different version. The argument afterward is about whose record is right.

> For co-created work, trust depends on all parties being able to check the same calculation.

The same example in RevRule

RevRule records the event split as a rule graph when the deal is made. Inputs: the ticket gross, the venue share, and each party's percentage of the net pool.

When the event closes, the engine calculates each entitlement and stores the full calculation in a hash chained ledger.

Participant	Rule applied	Amount owed
Venue	30% of gross	R375,000
Headline artist	65% of net	R568,750
Promoter	25% of net	R218,750
Ticketing partner	10% of net	R87,500
Total	Matches ticket gross	R1,250,000

Any party can be shown the inputs, the rules, and the result for the event. A corrected figure is added as a new entry, never written over the original.

RevRule gives every party to an event the same verifiable record of what was owed and why.
